Energy Management Systems

What is energy efficiency?

Energy efficiency consists of optimising the energy resources of an electrical installation to reduce power consumption and improve productivity without affecting the usual activity, whether in buildings, industries or distribution networks.

Why is it necessary?

Because proper energy management allows you to obtain the following benefits:

- I Reduce the economic cost of operating facilities and processes, by optimising and reducing consumption (kWh, kvarh).
- I Avoiding penalties, whether for reactive energy consumption or for maximum demand.
- I Ensure the sustainability of the economic system and the preservation of the environment by reducing CO₂ emissions.
- I Optimising the performance of the facilities, avoiding unnecessary consumption and improving technical management.
- I Avoiding indirect costs due to production process failures or breakdowns (leak control and harmonic filtering).

How to apply it?

CIRCUTOR has the necessary equipment within its 6 product families:

MEASUREMENT AND CONTROL

Measurement and supervision of the main electrical parameters of the installation.

PROTECTION AND CONTROL

Protection of facilities, equipment and people.

METERING

Consumption and billing management through energy meters.

REACTIVE COMPENSATION

Power factor correction and harmonic filtering to save on energy bill.

ELECTRIC MOBILITY

Smart points for recharging electric vehicles.

RENEWABLE ENERGY SOURCES

Integral solutions for the monitoring of photovoltaic installations.

Additional components of MV capacitor banks

Pressure switch

Disconnects the step/capacitor bank with the pressure generated after a serious fault inside a capacitor, in order to prevent greater damage. It enables the power circuit to be disconnected and signals the fault when the pressure reaches the maximum value.

Voltage presence indicator

A unit that lights up permanently when the power circuit is powered to provide greater safety during operations carried out on the unit.

Smoke detector

Smoke detectors are devices that warn about the possibility of internal combustion in the capacitor bank and that send a signal to activate an alarm (in the unit or at the discretion of the user), disconnecting the of the battery if necessary.

Electric circuit with opening delay for doors

For units that are ordered with doors in the power modules, Circutor offers the possibility of including a solenoid electrical interlock system in order to prevent access to the capacitor bank's interior if the necessary time has not elapsed.

SVacuum off-load and/or earthing switch

The cut-off and/or earthing switch enables the unit to be visually disconnected and isolated at the capacitor bank input.

Ventilation

In the case of capacitor banks installed in environmental conditions where natural convection cooling is insufficient, an auxiliary thermostat-controlled forced air system is essential for evacuating the internal heat of the capacitor bank.

Anti-condensation heating resistors

These are used to avoid condensation due to temperature gradients during the day, under saline environmental conditions, high relative humidity and low temperatures. Heating resistors controlled by thermostat and/or hygrometer.
